Supplementary Figures for Electrofishing Data

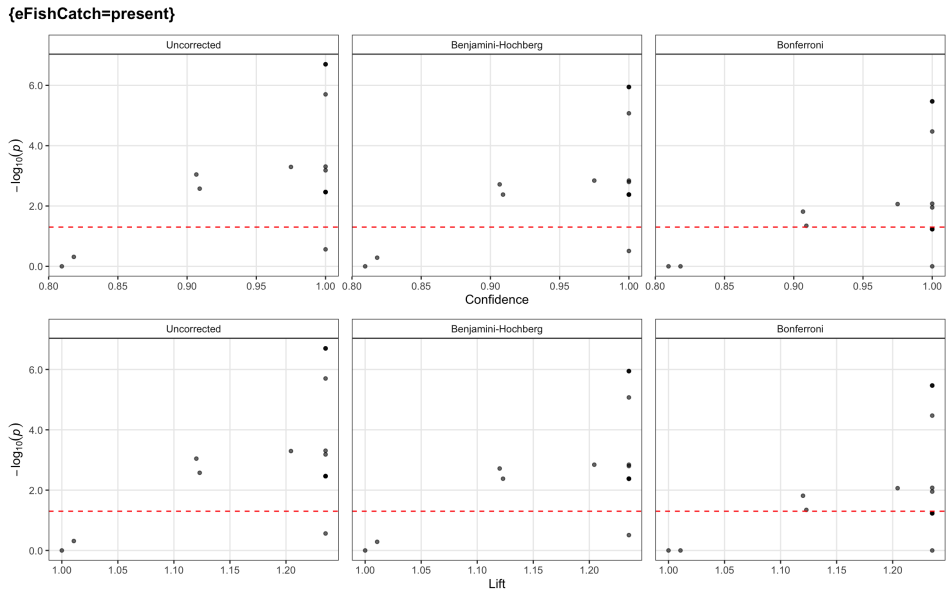

Figure 1. Scatterplots of association rule confidence (top row) and lift (bottom row) against $-\log_{10}(p)$ for the consequent `{eFishCatch=present}`. Each point is a single, non-redundant rule. Columns correspond to uncorrected p-values, Benjamini-Hochberg-adjusted p-values, and Bonferroni-adjusted p-values computed using one-sided Fisher's exact tests. The dashed red line indicates the log-transformed significance threshold ($\alpha = 0.05$; $-\log_{10}(0.05) = 1.30$)

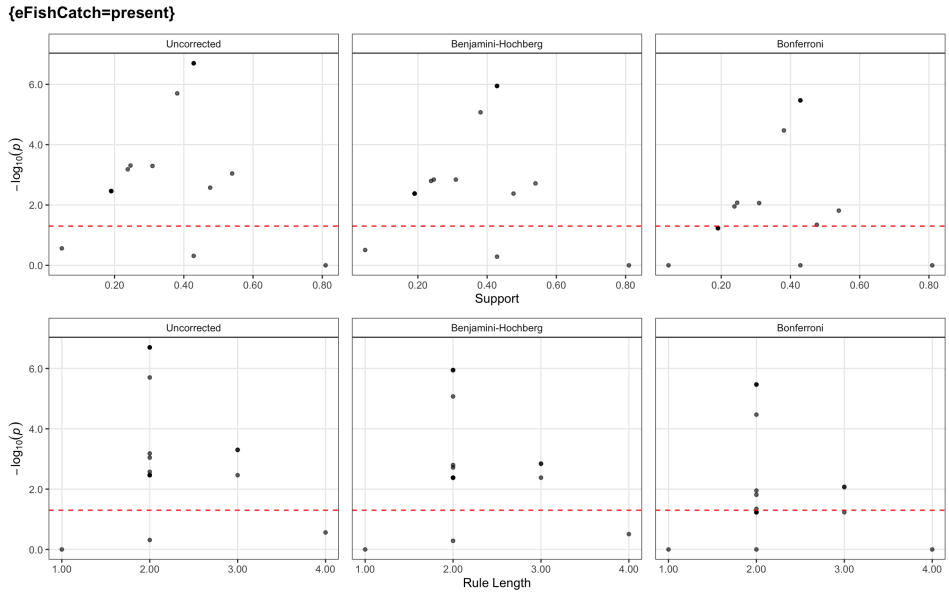

Figure 2. As in Figure 1, but for support (top row) and rule length (bottom row).
